

Beginner's GitHub

Clone, Push, Update

How-to Demo

Why Github

- **Sharing code:** sync local to cloud
- **Version control:** track changes in code
- **Collaborate**
 - Manage branches for concurrent working before merge
 - issue tracking and review code before merging to the main branch

GitHub

Beginner's How-to Demo

Clone to Local

Push to GitHub

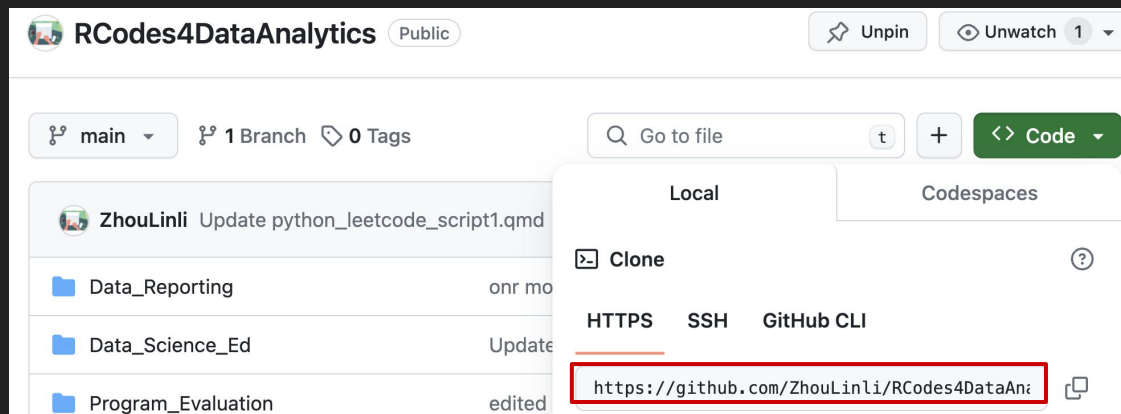

Update/ Interact

Clone a copy to local

1. Find the `repo_link` of your interested repo on github
2. Go to **terminal**, and set working directory (where you want to save the repo)

```
cd "/Users/linlizhou/Documents/Rprojects/"
```

3. **git clone** "link_of_aGitHubRepo"

Push a local to GitHub

1. Creating a new repository on GitHub
 - a. named the same as your local folder
 - b. do NOT initialize a README file, .gitignore, or license
2. Within **Terminal**
 - a. `cd "..."` #Set working directory to the folder you want to push
 - b. `git init`
 - c. `git add .`
 - d. `git commit -m "..."`
3. Copy the **push code** and put into terminal
4. Github and your folder are connected!

Update GitHub with the local

Work in Terminal

1. Set working directory (the folder you want to update)

```
cd "/Users/linlizhou/Documents/Rprojects/IR-Projects"
```

2. `git status`
3. `git add .`
4. `git add -A`
5. `git commit -m "somecomments"`
6. `git push`

Terminal
(cd, pwd)

git init

git status

git add .

git commit

git clone

git push
